Introduction

Support Set	
<u>staff</u>	(1) It is the <u>staff</u> and <u>food</u> quality that really needs fixing. (2) The views are amazing from any <u>location</u> , <u>staff</u> is friendly and the <u>food</u> was great too!
<u>food</u>	(1) It is the <u>staff</u> and <u>food</u> quality that really needs fixing. (2) The views are amazing from any <u>location</u> , <u>staff</u> is friendly and the <u>food</u> was great too!
<u>experience</u>	(1) Incredible spa <u>experience</u> ! (2) The food is always good and service has always been a great <u>experience</u> .
Query Set	
<u>experience</u> and <u>staff</u>	(1) It was such a horrible <u>experience</u> , she was rude, unmannered and non professional great clip should not retain such a waste <u>employee</u> !
<u>staff</u> and <u>food</u>	(2) The pool is gorgeous, the <u>rooms</u> clean, delicious <u>food</u> , and <u>staff</u> that went above and beyond to help us enjoy our stay.
<u>food</u>	(3) We had breakfast the next morning on the first floor and the <u>food</u> was surprisingly good.

---------	--

There exist several challenging issues:

- (1) Simply calculating the prototype by **averaging intra-class support samples** may cause that **different aspects share an identical prototype**.
- (2) When learning the prototype for a target aspect in multi-label scenarios, as each sentence probably contains several aspects, **some irrelevant aspects will inevitably disturb the learning procedure**.
- (3) Due to the diversity of human expression, **different sentences may contain different numbers of aspects**, so it is urgently needed to design an effective model to automatically predict the number of aspects in a sentence.

Figure 1: A meta-task example in 3-way 2-shot setting. The first column denotes the aspect label and the second column denotes the corresponding review sentence. As each review sentence may contain multiple aspects, we use different color background to mark the key words. The words in gray describe irrelevant (noisy) aspects, and the words in other colors represent the target aspects.

Method

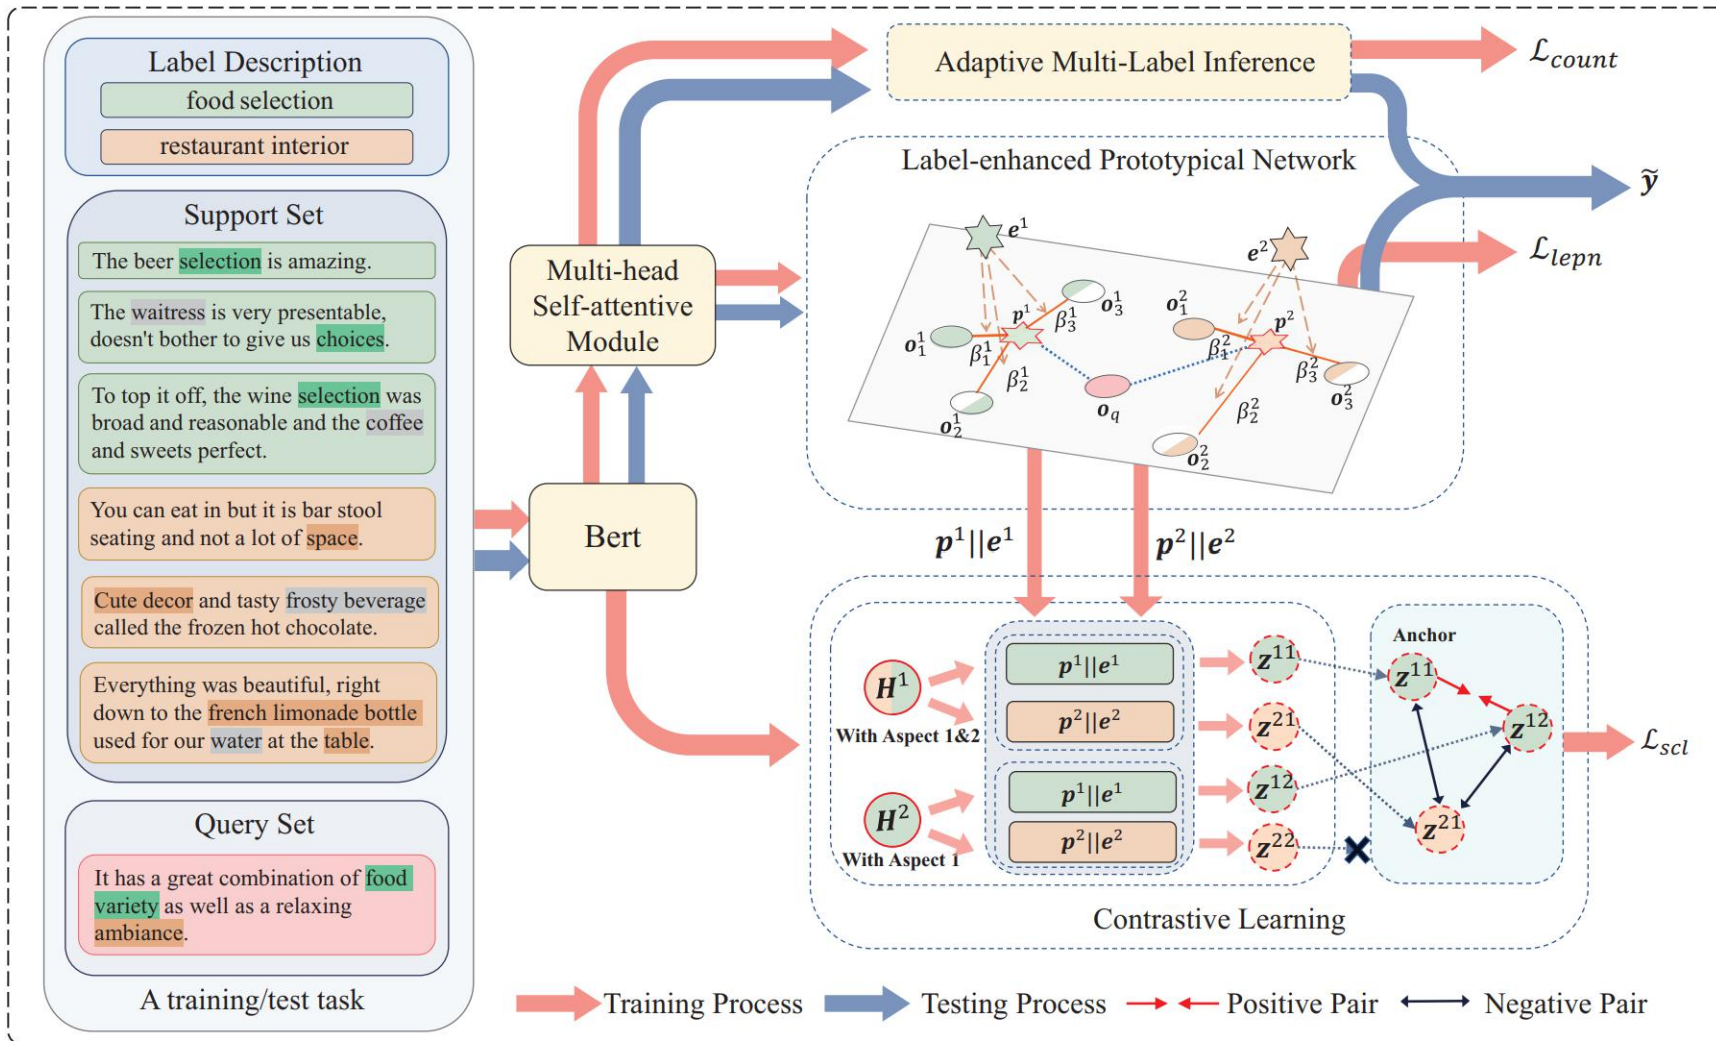

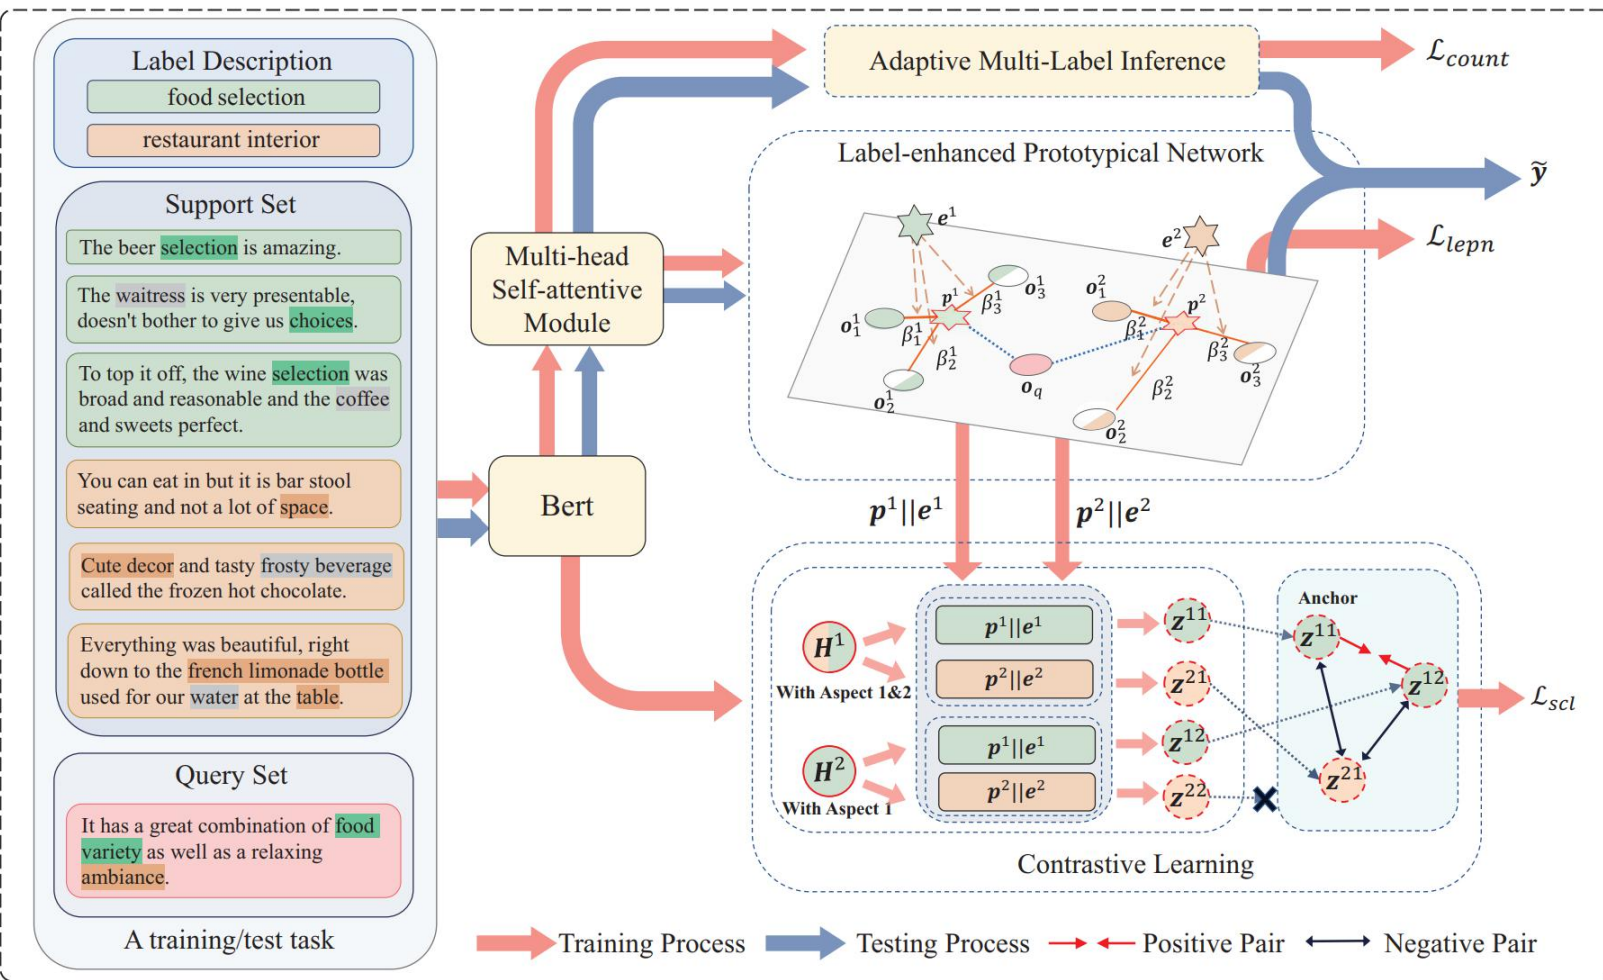

Figure 2: Illustration of our proposed method LPN.

Method

$$p(y = y^i | \mathbf{x}, \mathcal{S}) = \frac{\exp(-\|\mathbf{o} - \mathbf{p}^i\|_2^2)}{\sum_{j=1}^N \exp(-\|\mathbf{o} - \mathbf{p}^j\|_2^2)}, \quad (8)$$

$$\mathcal{L}_{lepn} = \frac{1}{|Q|} \sum_{\mathbf{x} \in Q} \sum_{i=1}^N -y^i \log p(y = y^i | \mathbf{x}, \mathcal{S}), \quad (9)$$

Feature Extraction

$$\mathbf{H} = [\mathbf{h}_1, \mathbf{h}_2, \dots, \mathbf{h}_T] \in \mathbb{R}^{d \times T}$$

$$\mathbf{A} = \text{softmax}(\mathbf{F}_2 \tanh(\mathbf{F}_1 \mathbf{H})), \quad (1)$$

$$\mathbf{M} = \mathbf{H} \mathbf{A}^T, \quad (2)$$

$$\mathbf{o} = \mathbf{F}_3 [\mathbf{m}_1 || \mathbf{m}_2 || \dots || \mathbf{m}_R], \quad (3)$$

Label-enhanced Prototypical Network

Considering the N -way K -shot setting, we have a support set \mathcal{S} which can be represented by $\mathcal{S} = \{\mathbf{x}_1^1, \mathbf{x}_2^1, \dots, \mathbf{x}_K^1, \dots, \mathbf{x}_1^N, \mathbf{x}_2^N, \dots, \mathbf{x}_K^N\}$

$$\mathcal{O} = \{\mathbf{o}_1^1, \mathbf{o}_2^1, \dots, \mathbf{o}_K^1, \dots, \mathbf{o}_1^N, \mathbf{o}_2^N, \dots, \mathbf{o}_K^N\}$$

$$\mathcal{E} = \{\mathbf{e}^1, \mathbf{e}^2, \dots, \mathbf{e}^N\}$$

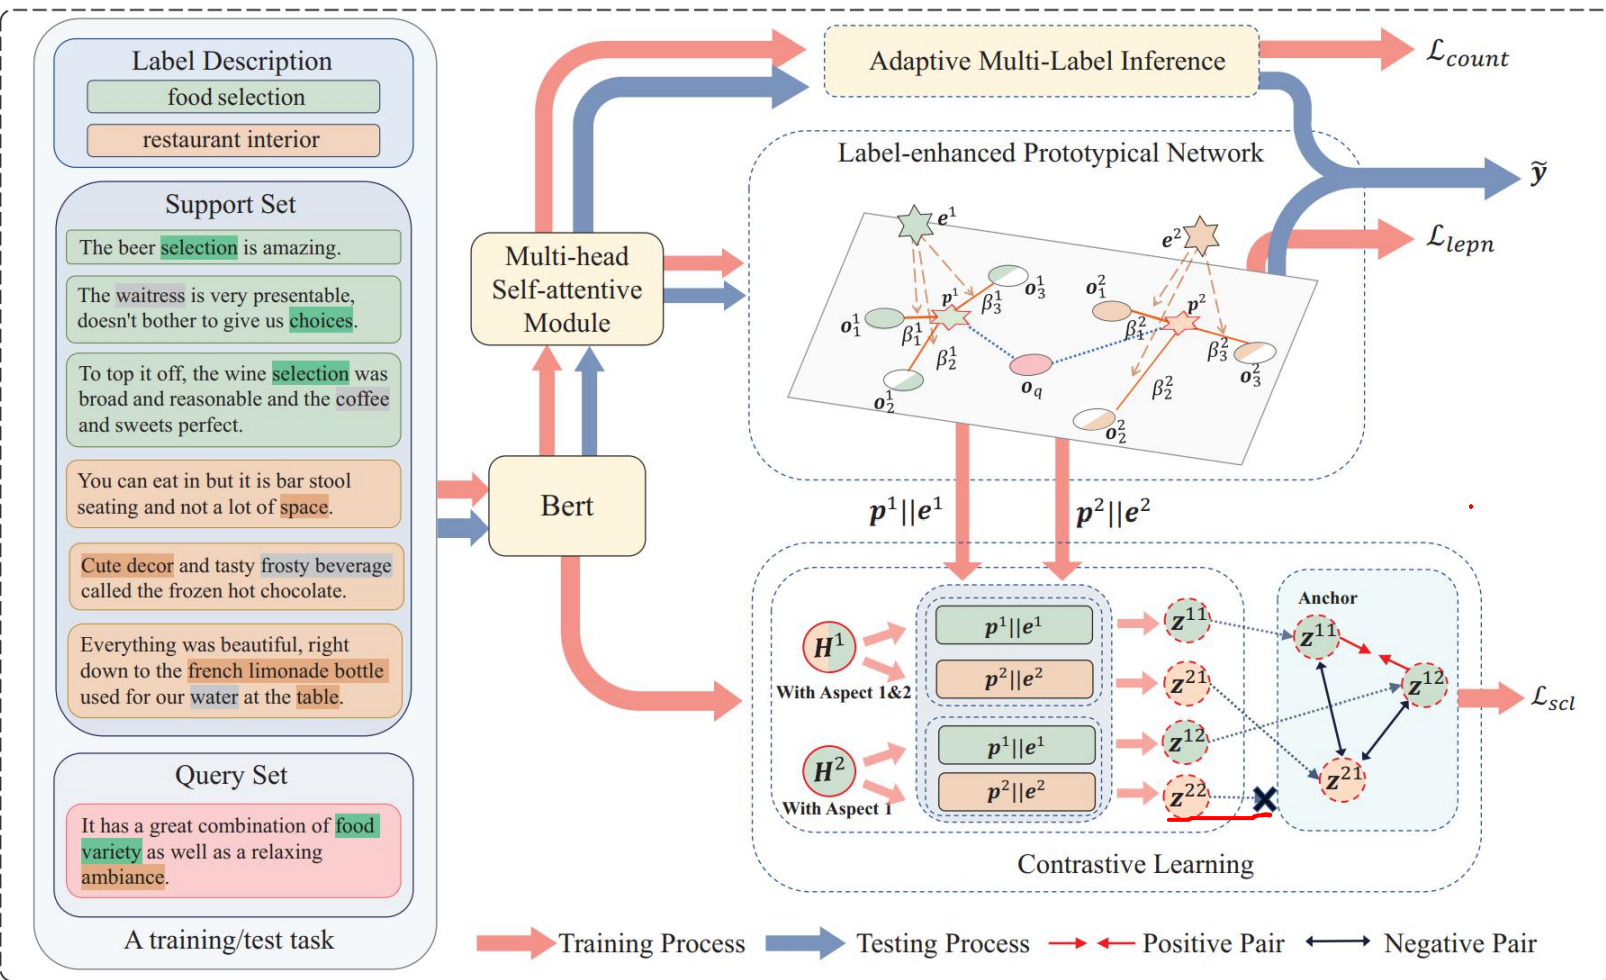

$$\alpha_j^i = \mathbf{o}_j^{iT} \mathbf{W} \mathbf{e}^i, \quad (4)$$

$$\alpha_j^i = \mathbf{o}_j^{iT} \mathbf{U} \mathbf{V}^T \mathbf{e}^i = \mathbf{1}^T (\mathbf{U}^T \mathbf{o}_j^i \circ \mathbf{V}^T \mathbf{e}^i), \quad (5)$$

$$\beta_j^i = \frac{\exp(\alpha_j^i)}{\sum_{j'=1}^K \exp(\alpha_{j'}^i)}. \quad (6)$$

$$\mathbf{p}^i = \sum_{j=1}^K \beta_j^i \mathbf{o}_j^i. \quad (7)$$

Method

Integrating with Contrastive Learning

$$P = \{p^1, p^2, \dots, p^N\}$$

$$E = \{e^1, e^2, \dots, e^N\}$$

$$\{a^1, a^2, \dots, a^N\}, \text{ where } a^i = [p^i || e^i] \in \mathbb{R}^{2d}$$

$$z^i = g^i H^T, \quad (10)$$

$$g^i = \text{softmax}((W_a a^i + b_a)^T H), \quad (11)$$

$$Z = \{z^{ij} \in \mathbb{R}^d | i \in \{1, 2, \dots, N\}, j \in \{1, 2, \dots, N_t\}\}$$

$$Y = \{y^{ij} \in \{0, 1\} | i \in \{1, 2, \dots, N\}, j \in \{1, 2, \dots, N_t\}\}$$

$$\mathcal{L}_{scl}^{ij} = -\frac{1}{|\Lambda^{ij}|} \sum_{z^{ik} \in \Lambda^{ij}} \log \frac{\exp(z^{ij} \cdot z^{ik} / \tau)}{\sum_{z^* \in \Gamma^{ij}} \exp(z^{ij} \cdot z^* / \tau)}, \quad (12)$$

$$\mathcal{L}_{scl} = \frac{1}{|I|} \sum_{z^{ij} \in I} \mathcal{L}_{scl}^{ij}. \quad (13)$$

Adaptive Multi-label Inference

$$n_l = \text{softmax}(W_l o + b_l), \quad (15)$$

$$\mathcal{L}_{count} = \frac{1}{|S \cup Q|} \sum_{x \in S \cup Q} -1^T (t_l \circ \log(n_l)), \quad (16)$$

$$\mathcal{L}_{total} = \mathcal{L}_{lepn} + \gamma \mathcal{L}_{scl} + \lambda \mathcal{L}_{count}, \quad (17)$$

$$I = \{z^{ij} \in Z | y^{ij} = 1\} \quad \Lambda^{ij} = \{z^{ik} \in \Gamma^{ij} | y^{ik} = y^{ij} = 1\} \quad \Gamma^{ij} = \{I \setminus z^{ij}\}$$

Experiments

Table 2: Dataset statistics. #Aspects and #Sentences denote the number of aspects and sentences respectively.

Dataset	Split	#Aspects	#Sentences
FewAsp (single)	Training	64	12800
	Validation	16	3200
	Testing	20	4000
FewAsp (multi)	Training	64	25600
	Validation	16	6400
	Testing	20	8000
FewAsp	Training	64	40320
	Validation	16	10080
	Testing	20	12600
